Quasi-Resonant type AC/DC converter IC

BD768xFJ-LB series Quasi-Resonant converter Technical Design
24V / 1A (SIC TO-3PFM SCT2H12NZ)

This application note describes the design of Quasi-Resonant converters using ROHM’s AC/DC converter IC BD768xFJ-LB series devices. It explains the selection of external components and PCB layout guidelines.

● Description
The BD768xFJ-LB series are Quasi-Resonant switching AC/DC converter for driving SiC (Silicon Carbide)-MOSFET. Using external switching MOSFET and current detection resistors provides a lot of flexibility in the design. Power efficiency is improved by the burst function and the reduction of switching frequency under light load conditions. This is the product that guarantees long time support in the Industrial market.

● Key features
- Quasi-resonant method (Maximum frequency control 120kHz) / Current mode
- Low power when load is light (Burst operation) / Frequency reduction function
- VCC pin: under voltage protection / over voltage protection
- Leading-Edge-Blanking function
- Over-current protection (cycle-by-cycle)
- ZT trigger mask function
- ZT Over voltage protection
- AC voltage correction function
- Soft start
- Brown IN/OUT function
- Gate Clamp circuit
- MASK Function

● Basic specifications
- Operating power supply voltage range (VCC): VCC: 15.0V~27.5V
- Operating current: Normal mode 0.80mA (Typ.)
- Burst mode 0.50mA (Typ.)
- Maximum frequency 120kHz (Typ.)
- Operating temperature range -40℃ to +105℃

(*) Product structure: Silicon monolithic integrated circuit. This product has no designed protection against radioactive rays.

(*) Operating the IC over the absolute maximum ratings may damage the IC. The damage can either be a short circuit between pins or an open circuit between pins and the internal circuitry. Therefore, it is important to consider circuit protection measures, such as adding a fuse, in case the IC is operated over the absolute maximum ratings.

1. Design of Isolated Fly-buck Quasi-Resonant Converter

Quasi-resonant converter is self-excited fly-back converter power supply system using the voltage resonance of the transformer primary winding inductor and resonant capacitor.

Generally, Quasi-resonant converter is possible to reduce the loss and noise than the PWM fly-back converter. Quasi-Resonant Converter becomes DCM (Discontinuous Conduction Mode) under light load, and switching frequency increases with the load increasing. When the load increased further, Quasi-Resonant Converter becomes BCM (Boundary Conduction Mode), and switching frequency decreases with the load increasing. The relation of switching Frequency and output load characteristics is shown in Figure 1-2. The Switching waveform at DCM and CCM is shown in Figure 1-2.

Figure 1-1. Switching Frequency – Output Load Characteristics

Figure 1-2. Switching waveform (MOSFET Vds,Ids)

IC detects Bottom and controls a timing of switching turn ON.
1-1. Transformer T1 design (24V1A, Vin(DC)=300V~900V)

1-1-1. Determination of fly-back voltage VOR

Turns-ratio Np:Ns and duty-ratio is determined along with Fly-back voltage VOR

\[
VOR = \frac{Np}{Ns} \cdot \frac{ton}{toff} \cdot \frac{Vo}{VIn}
\]

\[
\Rightarrow Np = VOR \cdot \frac{Vo}{Ns}
\]

\[
\Rightarrow \text{Duty} = \frac{VOR}{VIn + VOR}
\]

When VIN(MIN)=300V, VOR=204V, Vf=1.5V:

\[
\frac{Np}{Ns} = \frac{VOR}{Vo} = \frac{204V}{24V + 1.5V} = 8.0
\]

\[
\text{Duty (max)} = \frac{VOR}{VIn (min) + VOR} = \frac{204V}{300V + 204V} = 0.405
\]

(*) VOR is adjusted to set it below 0.5 in consideration of MOSFET's loss.

1-1-2. Determination of Minimum frequency fsw and calculation of primary side winding inductance Lp

The primary side maximum current Ippk and the primary side winding inductance Lp is determined from the minimum input voltage (VIN=300V) and the minimum frequency (Fsw=92kHz).

Other’s parameter is following:
Po=24V × 1A=24W, Po (max)=30W(de-rating 0.8) in consideration of over current protection.
Transformer efficiency: \(\eta=85\%\)
Resonance capacitor: \(Cv=100pF\)

\[
Lp = \frac{\left( \frac{VIn (min) \times \text{Duty (max)}}{2 \times \eta \times fsw} \right)^2}{\eta \times fsw} = 1755\mu H
\]

\[
Ippk = \sqrt{\frac{2 \times \text{Po(max)}}{\eta \times Lp \times fsw}} = 0.662\ A
\]

1-1-3. Determination of transformer size

Core size of the transformer is determined to EFD30 by the condition of Po(max)=30W.

<table>
<thead>
<tr>
<th>Output power Po(W)</th>
<th>Core size</th>
<th>Core sectional area Ae (mm²)</th>

<td>EI28/EE28/EER28</td>
<td>84</td>
</tr>
<tr>
<td>~80</td>
<td>EI33/EER35</td>
<td>107</td>
</tr>
</tbody>
</table>

(*) The above is guideline values. For details, check with the transformer manufacturer, etc.
1-1-4. Calculation of primary-side turn count \( N_p \)

Generally, the maximum magnetic flux density \( B(T) \) for an ordinary ferrite core is 0.4T @100°C, so \( B_{sat} = 0.3T \).

\[
N_p > \frac{L_p \times I_{ppk}}{Ae \times B_{sat}} = \frac{1750\mu H \times 0.66A}{68mm^2 \times 0.3T} = 57\text{turns}
\]

In order not to cause a magnetic saturation, the IC must be used in areas that do not saturate from AL-Value-NI characteristics.

In the case of \( N_p = 50 \) turns:

\[
AL = \frac{L_p}{N_p^2} = \frac{1750\mu H}{50\text{turns}^2} = 700\mu H/\text{turns}^2
\]

\[
NI = N_p \times I_{ppk} = 50\text{turns} \times 0.66A = 33A \cdot \text{turns}
\]

Transformer is saturated based on the AL-value-NI characteristics.

Set the number of primary winding so as not to be saturation region.

In the case of \( N_p = 64 \) turns:

\[
AL = \frac{L_p}{N_p^2} = \frac{1750\mu H}{64\text{turns}^2} = 427\mu H/\text{turns}^2
\]

\[
NI = N_p \times I_{ppk} = 64\text{turns} \times 0.66A = 42.2A \cdot \text{turns}
\]

In this case, this point is within the tolerance range

\( N_p = 64 \) turns is determined

1-1-5. Calculation of secondary-side turn count \( N_s \)

\[
\frac{N_p}{N_s} = 8 \quad \rightarrow \quad N_s = \frac{64}{8} = 8 \quad \text{turns}
\]

1-1-6. Calculation of VCC turn count \( N_d \)

When VCC=24V, \( V_{f_vcc}=1V \),

\[
N_d = N_s \times \frac{VCC + V_{f_vcc}}{V_{out} + V_f} = 8\text{turns} \times \frac{24V + 1.0V}{24V + 1.5V} = 7.8\text{turns}
\]

(*) In the case of driving SiC-MOSFET, since it is necessary to control the Gate voltage, VCC is required more than 22V.

As a result, the transformer specifications are as follows.

1-2. Selection of main components

1-2-1. MOSFET Q1

For MOSFET selection, it must be considered maximum voltage between the drain and source, peak current, losses due to Ron, maximum power dissipation of the package.

At low input voltage, the ON time of the MOSFET becomes long and the heat generated by Ron loss is bigger.

Be sure to confirm the state incorporated in the product and execute the heat dissipation of the heat sink as needed.

Current rating should be selected twice about Ip pk.

\[ V_{ds(\text{max})} = V_{\text{IN}(\text{max})} + V_{\text{OR}} + V_{\text{spike}} = V_{\text{IN}(\text{max})} + (V_{\text{out}} + V_f) \times \frac{N_p}{N_s} + V_{\text{spike}} = DC900V + (24V + 1.5V) \times \frac{64\text{A}}{8\text{turns}} + V_{\text{spike}} = 1104V + V_{\text{spike}} \]

Calculation of Vspike is difficult. MOSFET breakdown voltage is 1700V by using a snubber circuit.

In this design example, ROHM's MOSFET SCT2H12NZ(1700V 4A 1.15Ω) is selected.

Below show the typical characteristics of SCT2H12NY. Please refer to the SCT2H12NY data sheet for formal data.

<tr>
<td>300&lt;</td>
<td>1 x Pout(W)</td>
</tr>
</tbody>
</table>

(*)When selecting, also consider other specifications such as the retention-time.

The breakdown voltage of the capacitor is required above the maximum input voltage.
VIN(MAX)/de-rating=900V/0.8=1125V

Using three 450V breakdown voltage capacitors in series, the breakdown voltage of the capacitor is 450V x 3 = 1350V.
As noted, when connecting the capacitors in series, the balanced resistance is required for a constant voltage applied to all capacitors. Since the resistance is in loss, it is recommended to use more resistance 470kohm.

R1,R2,R3,R4,R5,R6’s loss is below.
P11_12_13_14_15_16=VN(MAX) x VIN(MAX)/R=900V x 900V/2.82Mohm=0.287W

It is shown in Figure 1-5.

The current-sensing resistor limits the current that flows on the primary side to provide protection against output overload.

\[
R_{19} = \frac{V_{CS}}{I_{ppk}} = \frac{1.0V}{0.66A} = 1.51\Omega
\]

Sensing resistor loss P_R19:

\[
P_{R19(peak)} = I_{ppk}^2 \times R_{19} = 0.66A^2 \times 1.5\Omega = 0.6534W
\]

\[
P_{R19(rms)} = I_{rms}^2 \times R_{19} = \left(1.0A \times \frac{Duty\ (max)}{3}\right)^2 \times R_{19} = \left(0.66A \times \frac{0.404}{3}\right)^2 \times 1.0 = 0.0586W
\]

Set the value 1W or above in consideration of pulse resistance.
The structure of the resistance may vary the pulse resistance even with the same power rating.
Check with the resistor manufacturers for details.
1-2-4. Overload protection correction setting resistor: R20

BD768xFJ-LB series has overload protection correction function in the input voltage. After the IC detects overload, there is a delay time to stop the switching operation. This delay is to increase the overload protection point with an increase input voltage. Correction function reduces the current detection level when it equals or exceeds an input voltage value. This function corrects the overload.

Since the input voltage range is DC300V ~ DC900V, switching voltage is set to DC400V. Izt is the current flowing from the IC to the transformer Nd winding in time of the switching ON. Izt lower the current detection level at the top than 1mA, overload protection point is lowered.

\[
R20 = VIN(change) \times \frac{Nd}{Np} \times \frac{1}{Izt} = 500V \times \frac{8\text{turns}}{64\text{turns}} \times \frac{1}{1mA} = 62.5\Omega
\]

Check whether the rating load can be taken after the point of over load protection is switched.

When the IC switches CS over current voltage level, it is changed from 1.0V to 0.7V.

\[
VIN(change) = R20 \times \frac{Np}{Nd} \times Izt = 56k\Omega \times \frac{64\text{turns}}{8\text{turns}} \times 1mA = 448V
\]

\[
Ippk' = \frac{Vcs}{R19} = \frac{0.70V}{1.5\Omega} = 0.466A
\]

\[
ton' = \frac{Lp \times Ippk'}{VIN(change)} = \frac{1750uH \times 0.466A}{496V} = 1.64us
\]

\[
Ispk' = \frac{Np}{Ns} \times Ippk' = \frac{64\text{turns}}{8\text{turns}} \times 0.466A = 3.728A
\]

\[
Ls = Lp \times \left(\frac{Ns}{Np}\right)^2 = 1750uH \times \left(\frac{8\text{turns}}{64\text{turns}}\right)^2 = 27.34uH
\]

\[
toff' = \frac{Ls \times Ispk'}{Vout + Vf} = \frac{27.34uH \times 3.728A}{24V + 1.5V} = 3.997us
\]

\[
tdelay = \pi \times \sqrt{Lp \times C_v} = 3.14 \times \sqrt{1750uH \times 100pF} = 1.3us
\]

\[
fswn' = \frac{1}{ton' + toff' + tdelay} = \frac{1}{1.64us + 3.997us + 1.3us} = 143kHz
\]

\[
Po' = \frac{1}{2} \times Lp \times Ippk'^2 \times fswn' \times \eta = \frac{1}{2} \times 1750uH \times 0.466A^2 \times 120kHz \times 0.85 = 19.38W
\]

When Po' is under the rated output power, R19 has to be adjusted.

In this board, furthermore, if the over load point is adjusted by a resistor of 100 kHz, the point is changed to 816V because the maximum frequency of the IC is restricted to 120 kHz. Regarding the over load protection point, please check in an actual product.

![Figure 1-6. The waveform of Switching](image)

Transformer efficiency: \(\eta = 0.85\)

Figure 1-7. Input voltage correction circuit of overcurrent detection (reference value)
1.2-5. Setting resistor for ZT terminal voltage: R21

The ZT bottom detected voltage is Vzt1=100mV (typ) (ZT fall), Vzt2=200mV (typ) (ZT rise), and ZT OVP (min) is 3.30V, so as a guide, set Vzt to 1V to 3V.

\[
V_{zt} = (V_{out} + V_f) \times \frac{Nd}{Ns} \times \frac{R21}{R20 + R21} = 2.7V \rightarrow R21 = 11.84k\Omega
\]

1.2-6. ZT terminal capacitor: C11

C11 is a capacitor for stability of ZT voltage and timing adjustment of the bottom detection. Check the waveform of ZT terminal and the timing of bottom detection, and adjust it as necessary.

1.2-7. VCC-diode: D18

A high-speed diode is recommended as the VCC-diode. When D13 \_Vf=1V, reverse voltage applied to the VCC-diode:

\[
V_{dr} = VCC(\text{max}) + V_f + V\text{INmax} \times \frac{Nd}{Np}
\]

This IC has VCC OVP function, VCC OVP (max) = 31.5V.

Reverse voltage of the diode is set so as not to exceed the Vr of diode in conditions of VCC OVP (max).

\[
V_{dr} = 31.5V + 1.0V + 900V \times \frac{8\text{turns}}{64\text{turns}} = 145V
\]

With a design-margin taken into account, 145V/0.7 \(\approx\) 200V \(\rightarrow\) 200V component is selected.

(Example: ROHM’s RF05VAM2S 200V 0.5A)

1.2-8. VCC winding surge-voltage limiting resistor: Rvcc1

Based on the transformer’s leakage inductance (Lleak), a large surge-voltage (spike noise) may occur during the instant when the MOSFET is switched from ON to OFF. This surge-voltage is induced in the VCC winding, and as the VCC voltage increases the IC’s VCC overvoltage protection may be triggered.

A limiting resistor R16 (approximately 5Ω to 22Ω) is inserted to reduce the surge-voltage that is induced in the VCC winding. Confirm the rise in VCC voltage while the resistor is assembled in the product.
1-2-9. VCC starter resistance; R11, R12, R13, R14 capacitance: C5, C6 and Rectifier diode: D18, D19

Start resistance $R_{\text{START}}$ is the resistance required to start the IC.

When the start resistance $R_{\text{START}}$ value is reduced, the standby power is increased and the startup time is shortened. Conversely, when the start resistance $R_{\text{START}}$ value is increased, the standby power is reduced and the startup time is lengthened. When BD768xFJ is in standby mode, current $I_{\text{OFF}}$ becomes 40µA (Max). However, this is the minimum current required to start the IC. In this case, current $I_{\text{OFF}}$ is 40µA (Max) with margin.

Input voltage $V_{\text{IN, start}} = 180V$: $V_{\text{CCUVLO}}(\text{max}) = 20V$: $I_{\text{VCC-protected}}(\text{min}) = 0.3mA$:

$R_{\text{start}} < (V_{\text{CC-start}} – V_{\text{CCUVLO}}(\text{min})) / I_{\text{start}}(\text{max}) = (180V – 20V) / 40\mu A = 4000kohm$

$R_{\text{start}} > (V_{\text{IN, max}} – V_{\text{CC-ovp}}(\text{max})) / I_{\text{CC-protect}} = (900V – 31.5V) / 0.3mA = 2895kohm$

$2895kohm < R_{\text{start}} < 4000kohm$

From the above results, set $R_{\text{start}} = 2940kohm$ (1Mohm $\times 2 + 470kohm \times 2$ series).

Start-up time is shown in Figure 1-8.

![Start up time VS Input Voltage](image)

**Figure 1-8. Start up time**

A VCC capacitor is needed to stabilize the IC’s VCC voltage. Capacitance of 2.2µF or above is recommended.

This example is recommended circuit of Figure 1-9 for the start-up time and stability.

At startup, only the C6 works for fast start. After starting, after the output voltage is above a certain voltage, C5 operates. D18 is recommended Low IR Switching diode. (Example Rohm 1SS355VM)

![resistance of Starter and VCC capacitor](image)

**Figure1-9. resistance of Starter and VCC capacitor**
1-2-10. Brown IN/OUT resistance: R7,R8,R9,R10,R15 and BO capacitor: C8

When the input VH value is low, the brown out function stops the DC/DC operations (The IC itself continues to operate).

In the following example, VHON is the operation start VH voltage (L to H), and VHOFF is the operation stop VH voltage (H to L).

- IC operation start (OFF => ON) \( (V_{HON} - 1.0) / R_H = 1.0 / R_L + 15 \times 10^{-6} \)
- IC operation stop (ON => OFF) \( (V_{HOFF} - 1.0) / R_H = 1.0 / R_L \)

Based on the above, \( R_H \) and \( R_L \) can be calculated as follows.

\[
R_H = \frac{(V_{HON} - V_{HOFF})}{(15 \times 10^{-6})} \quad R_L = 1.0 / (V_{HOFF} - 1.0) \times R_H
\]

\( V_{HON} = 90V, \ V_{HOFF} = 60V \): It becomes the circuit shown in Figure 1-10.

It should be noted that the BO terminal is required capacitor C8.

BO line is weak in noise for high impedance. Recommended is 0.01\( \mu F \) ~ 0.1\( \mu F \).

![Figure 1-10. Brown IN/OUT setting](image-url)
1-2-11. Snubber circuits: C snubber 1, R snubber1, D13,D14, D15,D16

Based on the transformer’s leakage inductance (Lleak), a large surge-voltage (spike noise) may occur during the instant when the MOSFET is switched from ON to OFF. This surge-voltage is applied between the MOSFET’s Drain and Source, so in the worst case damage to MOSFET might occur. RCD snubber circuits are recommended to suppress this surge-voltage.

(1) Determination of clamp voltage (Vclamp) and clamp ripple-voltage (Vripple)

The clamp voltage is determined by the MOSFET’s withstand voltage considering a design margin.
Vclamp = 1700V × 0.8 = 1360V

The clamp ripple-voltage (Vripple) is set about 50V.

(2) Determination of R snubber 1

R snubber 1 is selected according to the following conditions.

\[ R_{\text{snubber 1}} < 2 \times \frac{V_{\text{clamp}}}{L_{\text{leak}}} \times \frac{V_{\text{VOR}} - V_{\text{clamp}}}{I_{p} \times f_{\text{sw}}(\text{max})} \]

\[ L_{\text{leak}} = L_{p} \times 10\% = 1750\mu H \times 10\% = 175\mu H \]

In the case of \( P_{0}=25W \), \( V_{\text{IN}}(\text{max})=900V \), \( I_{p} \), \( f_{\text{sw}} \) is calculated

\[ P_{0} = \frac{1}{2} \times L_{p} \times I_{p}^{2} \times f_{\text{sw}} \times \eta \]

\[ I_{p} = \frac{V_{\text{CS}}}{R_{\text{CS}}} \quad \text{fsw} = \frac{1}{\text{ton} + \text{toff} + \text{tdelay}} \]

\[ \Rightarrow V_{\text{CS}}=0.7V, \quad I_{p}=0.466A, \quad f_{\text{sw}}=161kHz \]

\[ R_{\text{snubber 1}} < 2 \times 1360V \times \frac{1360V - 204V}{175\mu H \times 0.466^{2} \times 120kHz} = 253k\Omega \]

R snubber 1 loss \( P_{\_R \text{snubber 1}} \) is expressed as

\[ P_{\_R \text{snubber 1}} = \frac{(V_{\text{clamp}} - V_{\text{IN}})^{2}}{R_{\text{snubber 1}}} = \frac{(1360 - 900)^{2}}{200k\Omega} = 1.05W \]

A more than 2W component is determined with consideration for design margin.

(3) Determination of C snubber 1

\[ C_{\text{snubber 1}} > \frac{V_{\text{clamp}}}{V_{\text{ripple}} \times f_{\text{sw}}(\text{min}) \times R_{\text{snubber}}} = \frac{1360V}{50V \times 120kHz \times 200k\Omega} = 1607pF \]

The voltage applied to C snubber 1 is 1360V-900=460V.

C snubber 1 is set 600V or above with design margin.

(4) Determination of D13,D14

Choose a fast recovery diode as the diode, with a withstand voltage that is at or above the MOSFET’s Vds (max) value.
The surge-voltage affects not only the transformer’s leakage inductance but also the PCB substrate’s pattern.

Confirm the Vds voltage while assembled in the product, and adjust the snubber circuit as necessary.

(5) TVS: D15, D16

For excellent protection performance, it is possible to cramp the transient noises. Please determine after checking the withstand voltage and operation waveform.
1-2-12. FB terminal capacitor: C12
C12 is a capacitor for stability of FB voltage (approximately 1000pF to 0.01uF).

1-2-13. MOSFET gate circuit: R16,R17,R18,D17
The MOSFET's gate circuits affect the MOSFET's loss and the generation of noise. The Switching speed for turn-on is adjusted using R16+R17, and for turn-off is adjusted using R16, via the drawing diode D17.
(Example: R16: 10Ω 0.25W, R17: 150Ω, D17: SBD 60V 1A)
In the case of Quasi-Resonant converters, switching-loss basically does not occur during turn-on, but it occurs predominantly during turn-off. To reduce switching-loss when the IC turned off, turn-off speed can be increased by reducing R16 value, but sharp changes in current will occur, which increases the switching-noise. Since there is a trade-off relation between loss (heat generation) and noise, measure the MOSFET's temperature rise and noise while it is assembled in the product, and adjust it as necessary.
Also, since a pulse current flows to R16, check the pulse resistance of the resistors being used.
R18 is the resistance to pull down the gate of the MOSFET. The recommended value is 10kohm ~ 100kohm.

1-2-14. Output rectification diode: DN1
Choose a high-speed diode (Schottky barrier diode or fast recovery diode) as the output rectification diode.
When Vf=1.5V, reverse voltage applied to output diode is
\[ V_{dr} = V_{out(max)} + V_f + V_{In(max)} \times \frac{N_s}{N_p} \]
When Vout(max)=24.0V+5%=25.2V:
\[ V_{dr} = 25.2V + 1.5V + 900V \times \frac{8}{64} = 139.2V \]
139.2V/0.7=198V → 200V component is determined with consideration for design margin.
Also, diode loss (approximate value) becomes Pd=Vf x Iout=1.5V x 1.0A=1.5W
(Example: ROHM's RFN10T2D: 200V 10A, TO-220FN package)
Using a voltage margin of 70% or less and current of 50% or less is recommended.
Check the rise in temperature while assembled in the product. If necessary, reconsider the component and radiate heat by a heat sink or similar to dissipate the heat.
1-2-15. Output capacitors: C out 1, C out 2, C out 3, C out 4

Determine the output capacitors based on the output load’s allowable peak-to-peak ripple voltage (ΔVpp) and ripple-current.

When the MOSFET is ON, the output diode is OFF. At that time, current is supplied to the load from the output capacitors.

When the MOSFET is OFF, the output diode is ON. At that time, the output capacitors are charged and a load current is also supplied.

When ΔVpp = 200mV,

\[
Z_C \leq \frac{\Delta V_{pp}}{I_{spk}} = \frac{\Delta V_{pp}}{N_p \times I_{ppk}} = \frac{0.2V}{64 \times 0.66A} = 0.0379 \Omega \quad \text{at} \quad 60kHz (fsw \ min)
\]

With an ordinary switching power supply electrolytic-capacitor (low-impedance component), impedance is rated at 100 kHz, so it is converted to 100 kHz.

\[
Z_C \leq 0.0379 \Omega \times \frac{60}{100} = 0.02274 \Omega \quad \text{at} \quad 100kHz
\]

Ripple-current Is (rms):

\[
I_{s(rms)} = I_{spk} \times \frac{1-Duty}{3} = \frac{64}{8} \times 0.66A \times \sqrt{1-0.261/3} = 2.62A
\]

The capacitor’s withstand voltage should be set to about twice the output voltage.

Vout x 2 = 24V x 2 = 48V \rightarrow 50V over

Select an electrolytic capacitor that is suitable for these conditions.

(Example: low impedance type 50V, 470 μF x 3 parallel for switching power supply )

(*) Use the actual equipment to confirm the actual ripple-voltage and ripple-current.

1-2-16. Output voltage setting resistors: R25, R26, R28

When Shunt regulator IC2: Vref=2.495V,

\[
V_o = \left(1 + \frac{R_{25} + R_{26}}{R_{28}}\right) \times V_{ref} = \left(1 + \frac{82k\Omega + 4.3k\Omega}{10k\Omega}\right) \times 2.495V = 24.02V
\]

1-2-17. Parts for adjustment of control circuit: R24, R27, R32, C15

R27 and C15 are parts for phase compensation. Approximately R27=1k~30kΩ, C15=0.1uF, and adjust them while they are assembled in the product.

R32 is a resistor which limits a control circuit current. Approximately R32:300 to 2kΩ, and adjust it while it assembled in the product. R24 is a resistor for adjustment of minimum operating current of shunt regulator IC2.

In case of IC2: TL431, minimum operating current is 1mA. And when Optocoupler:PC1_Vf is 1V, R24 = 1V / 1mA = 1kΩ

1-3. EMI countermeasures

Confirm the following with regard to EMI countermeasures.

(*) Constants are reference values. Need to be adjusted based on noise effects.

- Addition of filter to input block
- Addition of capacitor between primary-side and secondary-side (approximately CY1,CY2+CY3: Y-Cap 2200pF)
- Addition of RC snubber to secondary diode
1-4. Output noise countermeasures

As an output noise countermeasure, add an LC filter
(approximately L:10μH, C: 10μF to 100μF) to the output.
(*) Constants are reference values.
Need to be adjusted based on noise effects.

![LC Filter Circuit](image.png)
1-5. Proposed PCB layout

A proposed layout (example) for these circuits is shown in Figure 1-12.

- Double-sided board, lead component view

![Proposed PCB Layout (Example)](image)

Notice

Precaution on using ROHM Products

1. Our Products are designed and manufactured for application in ordinary electronic equipments (such as AV equipment, OA equipment, telecommunication equipment, home electronic appliances, amusement equipment, etc.). If you intend to use our Products in devices requiring extremely high reliability (such as medical equipment [Note1]), transport equipment, traffic equipment, aircraft/spaceship, nuclear power controllers, fuel controllers, car equipment including car accessories, safety devices, etc.) and whose malfunction or failure may cause loss of human life, bodily injury or serious damage to property ("Specific Applications"), please consult with the ROHM sales representative in advance. Unless otherwise agreed in writing by ROHM in advance, ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of any ROHM’s Products for Specific Applications.

(Note1) Medical Equipment Classification of the Specific Applications

2. ROHM designs and manufactures its Products subject to strict quality control system. However, semiconductor products can fail or malfunction at a certain rate. Please be sure to implement, at your own responsibilities, adequate safety measures including but not limited to fail-safe design against the physical injury, damage to any property, which a failure or malfunction of our Products may cause. The following are examples of safety measures:
   [a] Installation of protection circuits or other protective devices to improve system safety
   [b] Installation of redundant circuits to reduce the impact of single or multiple circuit failure

3. Our Products are designed and manufactured for use under standard conditions and not under any special or extraordinary environments or conditions, as exemplified below. Accordingly, ROHM shall not be in any way responsible or liable for any damages, expenses or losses arising from the use of any ROHM’s Products under any special or extraordinary environments or conditions. If you intend to use our Products under any special or extraordinary environments or conditions (as exemplified below), your independent verification and confirmation of product performance, reliability, etc., prior to use, must be necessary:
   [a] Use of our Products in any types of liquid, including water, oils, chemicals, and organic solvents
   [b] Use of our Products outdoors or in places where the Products are exposed to direct sunlight or dust
   [c] Use of our Products in places where the Products are exposed to sea wind or corrosive gases, including Cl₂, H₂S, NH₃, SO₂, and NO₂
   [d] Use of our Products in places where the Products are exposed to static electricity or electromagnetic waves
   [e] Use of our Products in proximity to heat-producing components, plastic cords, or other flammable items
   [f] Sealing or coating our Products with resin or other coating materials
   [g] Use of our Products without cleaning residue of flux (even if you use no-clean type fluxes, cleaning residue of flux is recommended); or Washing our Products by using water or water-soluble cleaning agents for cleaning residue after soldering
   [h] Use of the Products in places subject to dew condensation

4. The Products are not subject to radiation-proof design.

5. Please verify and confirm characteristics of the final or mounted products in using the Products.

6. In particular, if a transient load (a large amount of load applied in a short period of time, such as pulse) is applied, confirmation of performance characteristics after on-board mounting is strongly recommended. Avoid applying power exceeding normal rated power; exceeding the power rating under steady-state loading condition may negatively affect product performance and reliability.

7. De-rate Power Dissipation depending on ambient temperature. When used in sealed area, confirm that it is the use in the range that does not exceed the maximum junction temperature.

8. Confirm that operation temperature is within the specified range described in the product specification.

9. ROHM shall not be in any way responsible or liable for failure induced under deviant condition from what is defined in this document.

Precaution for Mounting / Circuit board design

1. When a highly active halogenous (chlorine, bromine, etc.) flux is used, the residue of flux may negatively affect product performance and reliability.

2. In principle, the reflow soldering method must be used on a surface-mount products, the flow soldering method must be used on a through hole mount products. If the flow soldering method is preferred on a surface-mount products, please consult with the ROHM representative in advance.

For details, please refer to ROHM Mounting specification.

Notice-PGA-E
© 2015 ROHM Co., Ltd. All rights reserved.
Precautions Regarding Application Examples and External Circuits
1. If change is made to the constant of an external circuit, please allow a sufficient margin considering variations of the characteristics of the Products and external components, including transient characteristics, as well as static characteristics.

2. You agree that application notes, reference designs, and associated data and information contained in this document are presented only as guidance for Products use. Therefore, in case you use such information, you are solely responsible for it and you must exercise your own independent verification and judgment in the use of such information contained in this document. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties arising from the use of such information.

Precaution for Electrostatic
This Product is electrostatic sensitive product, which may be damaged due to electrostatic discharge. Please take proper caution in your manufacturing process and storage so that voltage exceeding the Products maximum rating will not be applied to Products. Please take special care under dry condition (e.g. Grounding of human body / equipment / solder iron, isolation from charged objects, setting of ionizer, friction prevention and temperature / humidity control).

Precaution for Storage / Transportation
1. Product performance and soldered connections may deteriorate if the Products are stored in the places where:
   [a] the Products are exposed to sea winds or corrosive gases, including Cl2, H2S, NH3, SO2, and NO2
   [b] the temperature or humidity exceeds those recommended by ROHM
   [c] the Products are exposed to direct sunshine or condensation
   [d] the Products are exposed to high Electrostatic

2. Even under ROHM recommended storage condition, solderability of products out of recommended storage time period may be degraded. It is strongly recommended to confirm solderability before using Products of which storage time is exceeding the recommended storage time period.

3. Store / transport cartons in the correct direction, which is indicated on a carton with a symbol. Otherwise bent leads may occur due to excessive stress applied when dropping of a carton.

4. Use Products within the specified time after opening a humidity barrier bag. Baking is required before using Products of which storage time is exceeding the recommended storage time period.

Precaution for Product Label
A two-dimensional barcode printed on ROHM Products label is for ROHM’s internal use only.

Precaution for Disposition
When disposing Products please dispose them properly using an authorized industry waste company.

Precaution for Foreign Exchange and Foreign Trade act
Since concerned goods might be fallen under listed items of export control prescribed by Foreign exchange and Foreign trade act, please consult with ROHM in case of export.

Precaution Regarding Intellectual Property Rights
1. All information and data including but not limited to application example contained in this document is for reference only. ROHM does not warrant that foregoing information or data will not infringe any intellectual property rights or any other rights of any third party regarding such information or data.

2. ROHM shall not have any obligations where the claims, actions or demands arising from the combination of the Products with other articles such as components, circuits, systems or external equipment (including software).

3. No license, expressly or implied, is granted hereby under any intellectual property rights or other rights of ROHM or any third parties with respect to the Products or the information contained in this document. Provided, however, that ROHM will not assert its intellectual property rights or other rights against you or your customers to the extent necessary to manufacture or sell products containing the Products, subject to the terms and conditions herein.

Other Precaution
1. This document may not be reprinted or reproduced, in whole or in part, without prior written consent of ROHM.

2. The Products may not be disassembled, converted, modified, reproduced or otherwise changed without prior written consent of ROHM.

3. In no event shall you use in any way whatsoever the Products and the related technical information contained in the Products or this document for any military purposes, including but not limited to, the development of mass-destruction weapons.

4. The proper names of companies or products described in this document are trademarks or registered trademarks of ROHM, its affiliated companies or third parties.
General Precaution

1. Before you use our Products, you are requested to carefully read this document and fully understand its contents. ROHM shall not be in any way responsible or liable for failure, malfunction or accident arising from the use of any ROHM's Products against warning, caution or note contained in this document.

2. All information contained in this document is current as of the issuing date and subject to change without any prior notice. Before purchasing or using ROHM's Products, please confirm the latest information with a ROHM sales representative.

3. The information contained in this document is provided on an "as is" basis and ROHM does not warrant that all information contained in this document is accurate and/or error-free. ROHM shall not be in any way responsible or liable for any damages, expenses or losses incurred by you or third parties resulting from inaccuracy or errors of or concerning such information.
